Abstract

In this paper, we develop a new index labelled the African Women Vulnerability index (AWVI) with a focus on rural women using the Round 7 Afrobarometer Survey. The AWVI comprises 59 indicators in six dimensions namely: safety, empowerment, health, education, economic prosperity and digitalisation. Our findings show that: (i) Botswana performs best while women in Guinea and Sudan are the most vulnerable. Indeed, Mauritius appears as a good example in some dimensions such as health and digitalisation. (ii) Except for the dimension digitalisation, rural women's vulnerabilities in other dimensions are very close to those at the national level. (iii) National vulnerability trends strongly explain rural women's vulnerability especially for the economic, empowerment and health dimensions.

Keywords: Index creation, gender, rural analysis, Africa

JEL Codes: C43, O18, O55.

1. Introduction

The question of gender has been extensively investigated in the existing literature. The main orientation in Africa is gender inequality. While women and men are born with the same rights to safety as well as access to social, health and education services, the reality shows that inequalities in access to the underlying services are still very apparent (ILO, 2011; African Union Commission, 2015). This reality is widely apparent in the context of Africa. The debate relative to gender has resurfaced for many reasons.

First, Goal 5 of the United Nations 2030 project for sustainable development is oriented towards the achievement of the objective of gender equality and empowerment: "Target 5.5: Ensure women's full and effective participation and equal opportunities for leadership at all levels of decision making in political, economic and public life" (SDSN, 2021). Moreover, Agenda 2063 of the African Union (AU) allocates an important weight to equality between women and men in order to attain sustainable development ("Africa of 2063 will have full gender parity, with women occupying at least 50% of elected public offices at all levels and half of managerial positions in the public and the private sectors. The economic and political glass ceiling that restricted women's progress will have been shattered" (African Union Commission, 2015, p. 9).

Secondly, the literature on gender has shown that promoting gender equality and women economic empowerment will positively affect global economic activity (Abney & Laya, 2018; Asongu & Odhiambo, 2020a). Hence, according to ILO (2011), reducing the gender gap in employment would generate an additional US\$1.6 trillion in output. Regarding sub-Saharan Africa, the gender gap reduction leads to a 0.2% increase in gross domestic product (GDP) growth. Reducing the gap in labour force participation rates between women and men by 25% by the year 2025 could raise GDP by 3.9% or US\$5.8 trillion. ActionAid International (2015) estimates that if gender gaps in employment and wages were closed, African women could gain an additional US\$0.7 trillion.

To date and to the best of our knowledge, the literature on women's vulnerability and especially in African countries is very sparse. The existing studies are globally oriented towards gender inequality (Gender Inequality Index(GII) of the UNDP, the World Economic Forum's Global Gender Gap Index, among others). Currently an African Gender Index (AGI) is jointly developed by African Development Bank Group and the United Nation Economic Commission for Africa (Africa Gender, 2020). The objective of this index is to calculate the inequality

between women and men. The AGI is composed of three dimensions (economic, social and empowerment). The index we develop in this paper differs from the existing indexes in different ways. Firstly, it is constructed by proportion from individual level data of the Afrobarometer survey in 34 African countries. Secondly, the index evaluates vulnerability contrarily to other indexes of inequality. This approach allows us to assess the exposure of women as opposed to inequality. Finally, to extend the existing literature, we are interested specifically in the vulnerability of rural women. This strategy is justified by the fact that women's vulnerability depends on place and context. Also, rural women play an important role in productivity and food security. For instance, according to FAO (2011), if female farmers were given the same access to resources as men, their agricultural production could rise by 20% to 30%, the national agriculture yields could increase by 2.5% to 4% while the number of hungry people could be reduced by 12% to 17%. However, rural women have less access to land control than rural men (Doss et al., 2013; Aguilar et al., 2014; Hallward et al., 2013).

The objectives of the paper are threshold. First, we construct an index to rank African countries in terms of women's vulnerability with respect to different dimensions such as safety, empowerment, health, education, economic prosperity and digitalisation. Second, specific emphasis is placed on the vulnerability of rural women. Finally, we examine whether, the national vulnerability of women reflects the vulnerability of rural women. In other words, the third objective allows us to evaluate whether compared to urban women, more efforts should be placed in promoting rural women in order to improve their socio-economic conditions.

The positioning of the above study departs from contemporary African-centric gender inclusive literature that has largely focused on, *inter alia*, nexuses between access to finance, mobile money, gender inclusion and social networks (Kairiza et al., 2017; Mannah-Blankson, 2018; Asongu & Odhiambo, 2018; Efobi et al., 2018; Bayraktar & Fofack, 2018; Bongomin et al., 2018); the importance of gender inclusion in rural zones, especially by leveraging on technology-driven agricultural programmes to bridge the rural-urban gap (Uduji & Okolo-Obasi, 2010; Uduji et al., 2020, 2021); the need to involve more women in science education (Elu, 2018); gender inclusion in promoting agricultural development that is sustainable (Theriaultet al., 2017; Ofori et al. 2021); the political implication of women in industrialisation (Nchofoung et al., 2021) and inequality thresholds that should not be exceeded in order for female economic participation to be positively impacted by good governance (Asongu & Odhiambo, 2020b).

The remainder of the paper is structured as follows. Section 2 provides the methodology for the construction of the index. Section 3 discusses the results while Section 4 checks the robustness of the results. Section 5 concludes.

2. The African Women Vulnerability Index (AWVI) construction

The different steps for constructing the AWVI are presented in this section. We first provide a theoretical framework which allows us to justify the selection variables and constitution of the dataset. Secondly, we present the method of normalization and finally the technique for weighting and aggregation.

2.1. Theoretical framework and data presentation

According to a handbook on constructing composite indicators, justification of the theoretical framework, definition of dimensions and selection of variables are the most important and problematic steps (OECD & Joint Research Centre, 2008). For Park and Claveria (2018), the theoretical framework represents the starting point of the composite indicator we need. In this study, the underpinnings of gender inequality and vulnerability discussed in the introduction constitute the theoretical foundation. We identify different vulnerabilities that African women face every day. Hence, we attempt to describe the vulnerabilities across different dimensions. To this end, we employ the dataset of the Afrobarometer. More precisely, we employ Round 7 surveys of the dataset which includes 45823 interviews completed in 34 countries between September 2016 and September 2018. It is worthwhile to note that the survey is handled in a comparative series of public attitude. It evaluates the attitude of citizens towards aspects such as democracy and governance, civil society and markets, inter alia. The Afrobarometer is a joined enterprise of the Institute for Justice and Reconciliation in South Africa (IJR), the Institute for Development Studies (IDS) at the University of Nairobi (Kenya), the Centre for Democratic Development (CDD-Ghana), and the Institute for Empirical Research and Political Economy (IREEP) in Benin. Additional technical support is provided to the program by the University of Cape Town and the Michigan State University.

We can justify the choice of the Round 7 dataset survey on many fronts. Firstly, a special module on gender equality is carried out in the dataset, thus allowing us to directly detect responses about vulnerabilities. Secondly, the vulnerability of women could be appreciated as a personal status, and such information cannot easily be captured by secondary or macro level

data. Fortunately, the Afrobarometer conducts face-to-face interviews in the language proposed by the respondent. Finally, it is a comprehensive survey covering most of African countries and freely available. Table 1 presents the sample characteristics. It appears there is equilibrium between males and females while the sample is dominated slightly by the rural population.

In Table 2, we describe the chosen indicators and their labels in order to understand the reference responses. The African Women Vulnerability Index (AWVI) has six dimensions (safety, empowerment, health, education, economic prosperity and digitalisation). The safety dimension assesses how women are vulnerable about their treatment both physically and psychologically. Seventeen indicators are included in this dimension. The empowerment dimension measures how African women are independent in their actions and whether they participate in society's decision-making process. Eleven indicators are in this dimension. For the health dimension, we have ten variables corresponding to the evaluation of women's social and health status. The education dimension assesses how women face problems of school services access and inequality in accessing educational opportunities. Six variables are included in this dimension. Regarding the economic dimension, seven indicators are selected. Within this dimension, we attempt to evaluate African women's vulnerabilities in the labour market, income and economic well-being. Finally, the digitalisation dimension (consisting of eight indicators) measures the level access to new technologies such as internet and bank services.

To construct our AWVI, we are only interested in women's responses to the interviews. The data are constituted by the proportion of women who favourably respond to the different questions. As is apparent in Table 2 on data description, we take the favourable response as the reference. So, all the data have a negative impact on vulnerability exposure. For example, regarding the question "Q89e. Own bank account", a value of 0.3 indicates that 30% of women have their own bank accounts. Hence, the higher the value of the indicator, the better the country's performance.

2.2. Data normalisation

There is a vast literature on data normalization methods among which we can mention Min-Max, ranking, Z-score, SoftMax, distance to a reference, *inter alia* (OECD & Joint Research Centre, 2008; Ebert & Welsch, 2004). Each of these methods has its advantages and

disadvantages but the results obtained are usually close, *ceteris paribus*. In this study, we use the well-known min-max method which is one of the most famous ways to normalize data (Diop & Asongu, 2020). It provides value scaled into the range [0, 1] where the minimum index and the maximum index are 0 to 1, respectively. One of the drawbacks of the method is that the presence of outliers could bias the results. Since we use proportions and therefore the same data measurement units, the probability that this event occurs is weak. The min-max transformation is given as follows:

$$I_{qc} = \frac{x_{qc} - min_c(x_q)}{max_c(x_q) - min_c(x_q)}$$

Where x_{qc} is the value of indicator q for country c. The minimum and the maximum values for each indicator are calculated across different countries. 34 of the 54 African countries are sampled for the period 2016 to 2018 because of data availability constraints at the time of the study. The data are from the latest round of the Afrobarometer Survey named Round 7-2016/2018. Accordingly, the focus is exclusively on 34 African countries because the Afrobarometer Round 7 survey from which indicators are borrowed, are individual interviews in 34 countries. Data are collected for both opinions and perceptions of individuals around land-related issues including women's land rights. The sampled countries are disclosed in Table 6 of the Appendix.

2.3. Weighting and aggregating

In the existing literature on gender inequality and vulnerability, most of the studies previously discussed have used classical methods such as arithmetic or geometric means (Africa Gender, 2020). These methods of weighting and aggregating are criticized in statistical tools for index creation. Accordingly, they are sensitive to extreme values and mainly are robust only if all values are equally important. In our paper, we use a multivariate data analysis technique for data aggregation. More specifically, we employ the principal component analysis (PCA) which best works mostly when the variables are not equally important (Tchamyou, 2017, 2020). It is used with the objective to reduce the number of variables by elucidating the observed variance of data via the linear relation of the original data. Loadings obtained from the PCA are used to compute the different weights instead of giving the same weight to all variables as it is with the arithmetic or geometric methods (Tchamyou et al., 2019). In the first step, we run the PCA on the variables in each of the six dimensions as presented in the tables in order to derive

alternative weights. Once the weights are obtained, we again employ the PCA to the six sub-indexes that are weighted to compile the AWVI.

3. Results and discussion

Before interpreting the vulnerability scores, we first evaluate the results of the PCA for the selection of the number of component factors in order to determine the different weights. We use the Kaiser criterion which drops all factors with eigenvalues below 1 (Asongu & Tchamyou, 2019; Diop et al., 2021; Diop & Asongu, 2020). The results of the PCA, loadings and weights are presented in Table 3 and Table 4 for vulnerability at the national level and the rural population, respectively. For national and rural women vulnerabilities, we note different weights for all indicators mostly for the empowerment dimension and the composite index. This result confirms that classical methods of weighting and aggregating (arithmetic, geometric and harmonic means) are not robust in the construction of indexes in this field.

Table 5 presents the descriptive statistics of the indexes and their sub-dimensions. For vulnerability at the national level, the composite index ranges from 0.273 to 0.848 with a mean of 0.503. On average, the best score is obtained from the empowerment dimension (0.508) while the poorest performance is noted on health dimension. The most volatile dimension is digitalisation where the value ranges from 0.069 to 0.986. Regarding the rural RWVI, the composite index is apparent in the scale of 0.146 to 0.787, with a mean of 0.455 indicating that the performance decreases by 4.8 points in the rural population compared to the National Women Vulnerability Index(NWVI). We also note the poorest performance of the digitalisation vulnerability (0.355) which is characterised by a high spread (0.220 to 0.998). On average, with the exception of digitalisation for which vulnerability decreases by 10 points compared to the NWVI, there is no significant difference between the two composite indexes.

3.1. National Women Vulnerability Index (NWVI)

Now we are interested in the vulnerability at the national level and its ranking for all countries. The results are presented in Table 6. The index scores are scaled from 0 to 1 and the closer the value is to 0, the poorer is the performance and vice versa. Since we have 34 countries, the ranking is from 1 (best country's performance) to 34 (worst country's performance). The NWVI reveals Botswana as the country where women are least vulnerable. Botswana earns a score of 0.848 and also ranks 1st in terms of safety (0.650) and education (0.688), 2nd (0.668) and 3rd in health and empowerment, respectively. It is worthwhile to note that in the economic dimension,

this country takes the modest 11th place with a score of 0.485. Botswana is followed by Namibia (2nd), Gambia (3rd), Ghana (4th) and Mauritius (5th). Another key fact is that Mauritius ranks first in two dimensions (health (0.703) and digitalisation (0.986)). Sudanese women are the most vulnerable (0.273) even if the country performs well in digitalisation (8th).

3.2. Rural Women Vulnerability Index (RWVI)

Table 7 presents the index scores only for the population of rural women. Once more, Botswana has the best score for the composite index (0.787). Namibia always keeps the 2nd place with a score of 0.730. Mauritius takes the 3rd place from Gambia which is now ranked 10th. Ghana continues to maintain the same rank (4th) as for the NWVI. Rural women in Guinea are the most vulnerable in Africa behind Morocco and Sudan, respectively. For the economic dimension, Ghana performs best (0.736) while Mauritius ranks best for health (0.717) and digitalisation (0.998). For education, Sao Tome and Principe is the top performer with a score of 0.613.

3.3. Comparative analysis between NWVI and RWVI

After having evaluated the NWVI and the RWVI, we can now focus our analysis on the comparison between the two indexes already created. It is apparent from the descriptive statistics that on average, when the two composite indexes are considered, at the national level, the score is 0.503 while it corresponds to 0.455 in the rural context, corresponding to a decrease of 4.8 points. However, the digitalisation dimension decreases substantially. In effect, digitalisation vulnerabilities decrease by 10 points (0.455 in the national index and 0.355 regarding the rural index). For a better view of the relationship between the indexes, a graph is used for illustration. Graph 1 confirms the strong relationships between the two indexes and their sub-dimensions. It appears that the national trend of women's vulnerabilities strongly explains rural women's vulnerabilities especially for the economic, empowerment and health dimensions.

4. Robustness checks

For robustness checks and sensitivity analysis, we make two changes. We first consider an alternative method for normalization. In place of Min-Max approach, a SoftMax method is employed. Secondly, we replace the PCA for weighting and aggregating by a geometric mean of aggregation. This method is used for the African Gender index (Africa Gender, 2020). The results are presented in Table 8. The findings show that the indexes have not changed much on

average, indicating that the results are robust to the use of alternative methods of normalization, weighting and aggregating.

5. Conclusion and future research directions

In this paper, we have created women's vulnerability index in African countries. Departing from the existing indexes (AGI, GII, *inter alia*), we have used data from the Afrobarometer Round 7 surveys where indicators are individual interviews in 34 countries. This option has the advantage to take into account personal status on women's vulnerabilities. In a second step, we have focused our interest on rural women by creating a rural women vulnerability index (RWVI).

The results can be summarized as follows. Firstly, both for national and rural indexes, Botswana is the best ranked. It is followed by countries such as Namibia, Mauritius and Ghana. Indeed, Mauritius ranks first in the heath and digitalisation dimensions. Secondly, on average, with the exception of the digitalisation dimension where there is a significant difference in the scores between national and rural vulnerability indexes, rural women's vulnerabilities in other dimensions are very close to those at the national level. Finally, the findings show that the national trend of women's vulnerabilities strongly explains rural women's vulnerability especially for the economic, empowerment and health dimensions.

The established findings in this study obviously leave room for future research especially as it pertains to employing the indexes to assess how they influence other macroeconomic factors or are influenced by other macroeconomic factors. In these suggested directions, it is worthwhile to focus on issues surrounding sustainable development goals (SDGs).

| Empowerment | Q20b. Member of voluntary association or community group | 2=Active member | | | | |
| Emp | Q19b. Better or worse: freedom to join political organizations | 5=Much more freedom | | | | |
| | Q19a. Better or worse: freedom to say what you think | 5=Much more freedom | | | | |
| | Q18b. Access to information: land ownership | 3=Very likely | | | | |
| | Q16. Men only as leaders vs. women leaders | 4=Agree very strongly with Statement 2* | | | | |
| | Q9. How dependent on receiving remittances | 0=Not at all | | | | |
| | Q92b. Location of toilet or latrine | 1=Inside the house | | | | |
| | Q57a. Better or worse: access to medical care | 4=Better | | | | |
| | Q56j. Handling ensuring enough to eat | 4=Very well | | | | |
| | Q56i. Handling providing water and sanitation services | 4=Very well | | | | |
| ulth | Q56g. Handling improving basic health services | 4=Very well | | | | |
| Health | Q49g. Pay bribe for medical care | 0=Never | | | | |
| | Q49e. Difficulty to obtain medical treatment | 1=Easy | | | | |
| | Q8c. How often gone without medical care | 0=Never | | | | |
| | Q8b. How often gone without water | 0=Never | | | | |
| | Q8a. How often gone without food | 0=Never | | | | |
| _ | Q97. Education of respondent | 5=Secondary school / high school completed | | | | |
| ion | Q77a. Girls and boys have equal chance at education | 4=Agree, 5=Strongly agree | | | | |
| Education | Q57c. Better or worse: government effectiveness on education | 4=Better | | | | |
| 4 | Q56h. Handling addressing educational needs | 4=Very well | | | | |
| | Q49c. Pay bribe for public school services | 0=Never | | | | |
| | • | | | | | |

| | Q49b. Difficulty to obtain public school services | 1=Very easy |
|----------------|--|----------------------------|
| | Q94. Employment status | 3=Yes, full time |
| 0 | Q77c. Women and men have equal chance of paying job | 4=Agree, 5=Strongly agree |
| Economic | Q77b. Women and men have equal chance to earn income | 4=Agree, 5=Strongly agree |
| GCO GCO | Q8d. How often gone without cooking fuel | 0=Never |
| Н | Q5. Your living conditions vs. others | 4=Better |
| | Q4B. Your present living conditions | 5=Very good |
| | Q4A. Country's present economic condition | 5=Very good |
| | Q93. Electric connection from mains | 5=All of the time |
| c | Q91b. How often use the internet | 4=Every day |
| tio | Q91a. How often use a mobile phone | 4=Every day |
| isa | Q90. Mobile phone access to internet | 1=Yes, has Internet access |
| Digitalisation | Q89f. Own mobile phone | 2=Yes, personally owns |
|)ig | Q89e. Own bank account | 2=Yes, personally owns |
| 1 | Q89d. Own computer | 2=Yes, personally owns |
| | Q89b. Own television | 2=Yes, personally owns |
| | | |

Source: Authors' calculation on data from Round 7 Afrobarometer Survey. Note:* Statement 2: Women should have the same chance of being elected to political office as men.
